BIN

Semester according to SPO

1. semester

Type of module

Compulsory module

Required prerequisites for the participation in the module according to the SPO

none

Recommended prerequisites for the participation in the module

School maths

Content

General principles:

- Body of real numbers
- Principle of complete induction
- Introduction to the field of complex numbers

Linear algebra:

- Vector spaces (linear independence, basis and dimension)
- Matrices (calculating with matrices, trace and determinant, rank of a matrix)
- Linear systems of equations
- Gaussian algorithm
- Linear mappings
- Eigenvalues and eigenvectors
- Diagonalisation
- Spectral theorem

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

None

Examination - type

Written exam (sP) according to § 23 APO

Examination - length/format

90 minutes

The concrete length/format of the examination will be determined in the study plan.

Language of examination

German

Condition for the award of credit points

None

Learning outcomes

1. students remember basic mathematical concepts and procedures relevant to computer science.
2. students understand the principles of algebraic and geometric mathematics and their application in computer science contexts.
3. students apply mathematical techniques to solve problems in computer science and develop solution strategies.
4. students analyse mathematical problems and identify suitable solution approaches taking into account various mathematical theories.
5. students evaluate different solution strategies for their efficiency and appropriateness in computer science.
6. students create mathematical models to abstract and solve complex problems in computer science.

Semester according to SPO

1. semester

Type of module

AWPM

Required prerequisites for the participation in the module according to the SPO

As a rule, none; exceptions are determined and announced by the Faculty of Natural Sciences and Humanities.

Recommended prerequisites for the participation in the module

none

Content

Selection of two general science electives (AWPF) (2 x 2 SWS) or one AWPF (1 x 4 SWS) from the range of subjects offered by the Faculty of Applied Natural Sciences and Humanities (FANG).

Range of subjects offered by the FANG in the areas of

- languages
- Cultural studies
- Natural sciences and technology
- Politics, law and economics
- Education, psychology and social sciences
- Soft skills
- Creativity and art.

Courses whose content is already part of or directly related to parts of other modules of the degree programme are excluded from the FANG catalogue. The corresponding courses are marked with a blocking note in the FANG subject catalogue.

The contents of the individual AWPFS are published on the FANG faculty's own homepage.

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

None

Examination - type

Written exam (sP) according to § 23 APO

Examination - length/format

90 minutes

The concrete length/format of the examination will be determined in the study plan.

Language of examination

German/English

Condition for the award of credit points

None

Learning outcomes

The subject-specific learning objectives depend on the AWPf selected. The students

- also acquire knowledge and competences that are not subject-specific but may be important for the desired career goal, such as special knowledge of foreign languages, natural sciences or social sciences
- analyse a wide variety of issues
- categorise subject-specific knowledge in an interdisciplinary context
- transfer what they have learnt to their current training
- have expanded their key competences and, where applicable, foreign language skills, which supports their personal development, also in intercultural terms
- are aware of their personal, social and ethical responsibilities.

Literature

depending on the selected AWPf

Required prerequisites for the participation in the module according to the SPO

bZv

Recommended prerequisites for the participation in the module

none

Content

The module teaches the basic concepts and techniques of database development. The relational data model and the relational algebra are introduced as theoretical foundations. One focus is on database modelling, in particular the creation of entity-relationship models (ER models) and their conversion into relational schemas, taking normal forms into account. Introduction to the SQL language, including data manipulation, data queries and the definition of schemas and transaction management. Database development and administration is practised in practical exercises and semester-long projects.

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

None

Examination - type

Written exam (sP) according to § 23 APO

Examination - length/format

90 minutes

The concrete length/format of the examination will be determined in the study plan.

Language of examination

German

Condition for the award of credit points

None

Learning outcomes

- Students can explain basic concepts of data persistence and the differences between persistent and non-persistent data.
- Students can define the central terms of relational databases, such as relation, primary key, foreign key and normalisation.
- Students understand relational algebra and can apply simple operations to it.
- Students can explain the connection between conceptual, logical and physical data modelling and justify their significance for database development.
- Students are able to create entity-relationship models (ERM) for given use cases and convert these into relational schemas.
- Students can formulate and execute SQL queries for data manipulation (DML) and schema definition (DDL).
- Students can analyse existing database schemas and evaluate them with regard to redundancy, consistency and normal forms.
- Students are able to analyse technical information requirements and derive suitable data structures and queries from them.

Content

Theoretical topics

- Recursion: end-recursive/non-end-recursive, linear recursion/tree recursion
- Complexity: O-notation, runtime complexity, memory complexity
- Higher order functions
- (Anonymous) lambda functions
- Abstraction mechanisms: procedural abstraction, abstraction with data
- Representation of complex data structures
- Sorting and searching

Practical topics

- Numerical algorithms
- Algorithms on lists
- Algorithms on trees
- Algorithms on fields
- Algorithms on symbolic data
- Algorithms on strings
- Algorithms on sets
- Algorithms on queues

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

Condition for the award of credit points

None

Learning outcomes

Students develop an understanding of the stylistics and aesthetics of programming at the beginning of their training.

Students understand the basic techniques for algorithmic problem solving.

Students generalise the appropriate application of important techniques for mastering complex systems.

Students apply concepts in the areas of recursion and abstraction.

Students apply standard solution techniques to algorithmic problems.

Learning outcomes

Students gain knowledge of the structure and organisation of digital computing systems of modern computer systems, as well as the milestones in the development of IT systems.

Students are able to

- explain technical realisation forms of circuits,
- implement a formal and programming-language circuit description,
- analyse unknown circuits based on an understanding of the structure and function of all important basic circuits and arithmetic units,
- evaluate circuits with the help of cost functions,
- develop simple circuits of their own.

Content

The Programming I module is about learning procedural programming and the first parts of object-oriented programming in the Java programming language. The ability to programme and thus to independently solve small problems in different areas is one of the basic skills expected of a (business) computer scientist.

The course consists of 13 lessons, which are made up of learning videos, the corresponding exercises, the Power Point slides for the videos and quizzes matching the material.

The learning videos are structured in such a way that students gradually familiarise themselves with the various language constructs and basic programming concepts. The accompanying seminar lessons are used to ask questions and consolidate the material.

The exercises are by far the most important part of the course. Students learn programming by solving problems independently. The tutorials help by giving students food for thought from the lecturer if a student gets stuck with a problem and by discussing and improving the quality of solutions. The exercises usually belong to the previous learning videos and pick up on their content.

There is a quiz for each lesson, which uses simple questions to give students the opportunity to check whether they know or understand the material covered.

Contents:

- Introduction/first programme (Hello world)
- Elementary language constructs (expressions, primitive variables, assignments)
- Essential (control) statements (conditional statements, branching, head- and foot-controlled loops)
- Methods, recursion, arrays, complex data types
- Object-orientation (introduction), classes, objects, (instance) methods, visibility
- Multidimensional arrays, behaviour of reference types, string methods, garbage collector

- Data structures (singly and doubly linked lists, binary trees, traversing trees)
 - Packages, implicit inheritance, relations using the example of equals
 - DRY principle, tell, don't ask principle
 - Optional: bitwise operators
-
- IDEs used: IntelliJ IDEA, Eclipse, VSCode, ...

This module is the basis for Programming 2 and the programming project.

Examination

Learning outcomes

Mathematical and scientific basics:

Students learn about analysis as another fundamental area of mathematics. Among other things, analysis serves as the basis for many applications in the natural sciences and technology, which can be solved on a computer with the help of computer science. It is also indispensable for a thorough understanding of probability theory and statistics, which in turn forms the basis for many specialist areas of computer science such as artificial intelligence (machine learning, deep learning), data science, big data, computer vision and image recognition, and much more.

Ability to develop and implement solution strategies:

The ability to develop and implement solution strategies is trained by solving mathematical problems.

The ability to think logically, analytically and conceptually:

Solving mathematical tasks trains the ability to think logically and abstractly.

Learning outcomes

Students learn project management skills, in particular the knowledge required for project managers. They are familiar with project management methods, processes and tools in the various IT project phases and can select and apply these depending on the situation. Students know the activities of software development in an IT project and can assign and describe sub-activities.

They can describe various process models (waterfall, V-model, agile, ...) and assign activities in the process models. Students know the basic activities, roles etc. of agile projects and can find their way around as a team member in an agile project, especially with Scrum.

Programming I

Content

The Programming II module is about learning object-oriented programming (in the Java programming language). In order to structure larger information systems, it is important to learn how these can be structured, designed and tested.

This course consists of 13 lessons, which are made up of learning videos, the corresponding exercises, the Power Point slides for the videos and quizzes relating to the subject matter.

The learning videos are structured in such a way that students are first confronted with tests and then gradually learn object-orientation and its application. The accompanying seminar lessons are used to ask questions and consolidate the material.

The exercises are by far the most important part of the course. Students learn object-orientated programming by solving problems independently. The tutorials help by giving students food for thought from the lecturer if a student gets stuck with a problem and by discussing and improving the quality of solutions. The exercises usually belong to the previous learning videos and pick up on their content.

There is a quiz for each lesson, which uses simple questions to give students the opportunity to check whether they know or understand the material covered.

Contents:

Unit tests (JUnit 5)

Dependency management (Maven)

Inheritance (specialisation, generalisation)

Enumerations

Abstract classes, interfaces, composition

Exceptions

streams

generics

Collections, associative arrays (maps)

Nested classes (static nested, inner, local, anonymous classes)

Lambda expressions

Threads

Design patterns: Builder, Decorator, Visitor

Fluent interfaces

Functional programming with the help of the Stream API

IDE: Eclipse or IntelliJ

The content and skills acquired in this module make the programming project much easier.

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

bZv - currently suspended

Examination - type

Written exam (sP) according to § 23 APO

Examination - length/format

90 minutes

The concrete length/format of the examination will be determined in the study plan.

Language of examination

German

Condition for the award of credit points

None

Learning outcomes

After successfully completing the module, students will be able to

- apply the concepts of object-oriented programming
- independently implement a solution strategy for writing object-oriented Java programmes
- implement partial solutions to larger programmes/problems
- structure problems into several sub-problems
- Implement tests for software systems
- Understand and use polymorphism in methods and types
- use class libraries to extend programmes
- understand first design patterns

Fundamentals of Computer Engineering

Content

- Historical development
- Calculator classifications (Flynn, Händler, Giloi)
- Computer arithmetic (representation of characters and numbers, IEEE 745, basic arithmetic operations, Booth algorithm)
- Microcomputer core with control and arithmetic unit (pipeline concept, dependencies and their resolution, dynamic scheduling: scoreboard, Tomasulo)
- Machine instructions (ISA, addressing types, assembler programming)
- x86 assembler (nasm, Linux/Ubuntu)
- RISC / CISC concepts (resource conflicts, µprogramming)
- Memory (structure of DRAM, SRAM, caches, coherence protocols)
- I/O and peripherals (external memory, buses)
- Parallel computers and multithreading
- Performance evaluation (basic terms, benchmarks)

Examination

Condition for the award of credit points

None

Learning outcomes

Students gain an understanding of the structure and operation of computer systems, and the operation of different computer architectures. They also acquire basic knowledge in the field of embedded systems.

.

Students are able to

- visualise basic components of simple computers,
- explain different forms of realisation of complex circuits,
- describe relevant memory technologies,
- analyse the structure and programming of processors,
- implement simple assembler programmes and take into account specific characteristics of a computer when programming,
- evaluate the performance of computers,
- design subcomponents of a simple computer.

Basic Knowledge of Object Oriented Programming

Content

The module will be taught in english this semester

The discipline of software engineering is part of practical computer science and deals with all activities of software development from Ideas of the user to the tested delivered system

Basic concepts

- Objectives and principles of software engineering
- Presentation of the result types of software development phases with method assignment
- Basics of object-oriented function and data modelling with UML
- Object-oriented analysis based on UML (use case modelling, creation of static models, creation of dynamic models)

In addition to these core activities, the following related topics are considered:

- Modelling
- Costs and benefits
- Software quality, quality assurance and testing (overview)
- Inspections and reviews
- Configuration management (rudimentary)
- Basics of data protection, privacy and ethics

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

None

Examination - type

Other exam (soP) according to §§ 26, 27 APO

Examination - length/format

Portfolio

Learning outcomes

1. the students understand the principles of software engineering and their applications in software development.
2. the students apply structured methods to collect, model, and specify requirements during customer discussions.
3. the students analyse requirements using UML diagrams and Use Cases to facilitate effective communication and design.
4. the students evaluate the role of testing in software development processes and classify relevant skills necessary for quality assurance.
5. the students create effective testing strategies by running and evaluating tests throughout all phases of the software life cycle.
6. the students conceptualise design solutions using simple UML diagrams to represent software architecture and functionality.
7. the students address ethical dilemmas, sustainability aspects, and system security requirements in software projects, integrating these considerations into their practice.

Recommended prerequisites for the participation in the module

Fundamentals of Algorithms and Data Structures, Programming I,
Programming II, Algebra, Analysis

Applicable programming knowledge from Programming I

Content

The course deals with various complex algorithms and data structures in computer science in theory and practical application.

Java is used to implement the solutions.

The following main topics are covered in theory and practice:

- The concept of algorithms, data structures
- Stacks, queues, lists (with optimisations)
- Graphs & various algorithms on graphs
- Different trees with their respective advantages and disadvantages
- Hashmaps and exploratory strategies
- Monte Carlo and Las Vegas algorithms
- Evolutionary algorithms
- Encryption algorithms and data protection
- Decentralised software and blockchain data structures

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

Learning outcomes

1. students know basic data structures and their performance characteristics.
2. students understand the functionalities and application areas of special graph- and tree-based algorithms.
3. students apply suitable data structures and algorithms for given use cases and can evaluate their performance and applicability.
4. students analyse technical problems in order to select suitable data structures and algorithms and evaluate their performance.
5. students develop their own algorithms to solve practical problems and implement them using Java.
6. students create algorithmic solutions for specific challenges and select the appropriate algorithms for implementation.
7. students evaluate the application scenarios of various algorithms using practical examples and recognise their relevance in real applications.

BIN, BISD

Semester according to SPO

3. semester

Type of module

Compulsory module

Required prerequisites for the participation in the module according to the SPO

None

Recommended prerequisites for the participation in the module

Programming 1 and Programming 2

Content

- Introduction to distributed systems, client-server, and peer-to-peer systems.
- Software architectures for backend systems (3-tier, hexagonal, monolithic vs. micro-service, event-driven)
- Frameworks to implement backend systems (e.g. Spring)
- Advanced database techniques, scalability, replication, sharding, ORM-tools, query caching, CAP theorem
- Protocols for remote procedure call, for example, GraphQL and Google RPC.
- Basics of the HTTP protocol and application in the form of Web APIs.
- Comprehensive introduction to the REST architecture principle: resources, URLs, CRUD, hypermedia, caching, security.
- Configuration of Web servers (Apache), load balancer, and public caches (nginx)
- Testing of backend systems, performance testing using JMeter, monitoring and logging
- Security aspects of network protocol and backend systems

In the traditional degree programme, the lecturer provides or agrees with the topics of the practical examples for the examination. In the BIN dual study programme, the lecturer consults with the company on a task, ensuring practical relevance and feedback from the company.

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

Condition for the award of credit points

None

Learning outcomes

- The students understand the fundamental concepts and differences of distributed systems, including their architecture and communication models.
- The students analyse various software architectures for backend systems and evaluate their suitability for different use cases.
- The students apply advanced database techniques such as replication and sharding to enhance data availability and performance.
- The students implement a backend system using a framework like Spring, following best practices for configuration, deployment, and security.
- The students compare different protocols for remote procedure calls, such as GraphQL and Google RPC, assessing their strengths and limitations.
- The students design RESTful APIs by applying the principles of the REST architecture, focusing on resources, URLs, CRUD operations, and security strategies.
- The students evaluate the security aspects of network protocols and backend systems, proposing improvements based on best practices.

Databases, programming and software engineering courses

Content

Classical and modern concepts for data management and analysis of (semi-)structured data are covered.

Topics include:

XML / JSON Technologies

- Basics of XML and JSON
- DTD and XML Schema
- XPath, XSLT
- Queries on JSON documents
- Usage Scenarios
- Data Management Concepts

Basics of Data Warehousing

- Multidimensional Data Modelling
- Data Sources: Integration of Relational Database Systems, Web Services, JDBC/ODBC
- Some additional information on Privacy and Information Security in DBMS
- Planning and Implementation of ETL Processes
- Online Analytical Processing (OLAP)
- Introduction to NoSQL Databases and Big Data

Graph Databases

- Introduction to Graphs and Graph Management Systems
- Graph Database Query Language Cypher
- Modelling Concepts in Graph Databases
- Selected Data Analysis Concepts and Algorithms
- Data Analysis with Graph Databases

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

None

Examination - type

Examination - length/format

90 minutes

The concrete length/format of the examination will be determined in the study plan.

Language of examination

German/English

Condition for the award of credit points

None

Learning outcomes

1. the students know the fundamental concepts and challenges related to data management and data analysis systems for businesses.
2. the students understand the components and architectures of data warehouse systems and their relevance in organisational contexts.
3. the students apply various data management methods, including non-relational databases (e.g., graph databases), in practical scenarios.
4. the students analyse data management processes and data analysis procedures, identifying key technologies and best practices used in enterprises.
5. the students evaluate solution strategies for application-specific problems in the fields of data management and data science, considering scalability and performance factors.
6. the students create data-driven solutions by designing and implementing database-based systems that address practical business challenges.
7. the students develop a comprehensive understanding of procedural models, multidimensional modelling, and database system integration in the context of data science.

Content

This module provides students with theoretical and practical knowledge and skills that can be applied in a professional working environment in a wide variety of areas.

Students learn and try out a range of methods, techniques and tools that are categorised into different focus areas. These include

- Learning and working techniques
- Scientific work
- Target group-orientated professional communication and
- Working in (international) teams

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

Learning outcomes

- Students apply methods for effective planning and structuring of their work processes
- Students name the basic principles of scientific work in computer science
- Students carry out a literature search and organise the results
- Students describe in detail the basics of designing effective scientific communication in the form of texts, presentations, posters and videos
- Students create scientifically orientated texts, presentations, posters and videos based on scientific standards
- Students learn relevant objectives, skills and best practices for planning, conducting and following up on various survey techniques (such as interviews, surveys)
- Students apply methods for effective communication in teams
- Students apply methods of interviewing to determine requirements

Algebra and analysis: Basic knowledge of linear algebra (in particular linear systems of equations, matrix algebra, vector spaces, scalar product), propositional and set algebra, combinatorics, differential and integral calculus.

Programming I: Programming logic, design of simple algorithms

Content

- Descriptive statistics: basic concepts, frequency distributions, location parameters, scattering parameters, linear correlation and regression analysis.
- Probability theory: result set, events, Kolmogorov's concept of probability, conditional probability and independence, discrete and continuous random variables, expected value and variance, law of large numbers, binomial distribution, hypergeometric distribution, Poisson distribution, exponential distribution, normal distribution, sums of random variables, central limit theorem.
- Inferential statistics: point and interval estimates, significance tests.
- Application and visualisation of stochastic methods using programming examples in Python or R.

Learning outcomes

After completing the module, students will be able to

- confidently apply basic concepts and terms of probability and statistics,
- calculate and interpret statistical ratios and probabilities and use them to describe data,
- select typical probability distributions and apply them to suitable, practical problems,
- analyse stochastic and statistical problems using logical and structured thinking and work on them in a solution-oriented manner,
- use the methods as a basis for further applications in computer science, data science and machine learning.

Programming I and Programming II

Content

- Definition and meaning of system-oriented programming
- Using the command line of an operating system
- Shell programming using the example of Bash
- Data processing on the command line with sed, awk, sort, jq
- Using AI assistance systems (e.g. GitHub Copilot, ChatGPT)
- Editing text documents with vim
- Version control system Git
- Introduction to the C programming language (syntax, data types, pointers, memory management)
- System programming under Linux (system calls, handling files, processes)
- Security aspects of system-related programming and protection mechanisms
- Structure of the Linux operating system
- Processes, process management, scheduling
- Inter-process communication, race conditions, deadlocks, semaphores, Petri nets and deadlock detection, philosopher problem, producer-consumer problem
- Memory management, memory abstraction, partitioning, fragmentation, free memory management, virtual memory, page exchange algorithms
- Input and output, direct memory access, interrupts, hard disks, file systems for hard disks
- Network communication and implementation of network protocols
- Hypervisor technologies, Docker containers, resource management

Learning outcomes

- The students understand the definition and principles of system-oriented programming, including its role in software development.
- The students demonstrate proficiency in using the command line of an operating system, applying advanced tools like sed, awk, sort, and jq for data processing tasks.
- The students develop shell scripts in Bash to automate system tasks and streamline operations effectively.
- The students utilize AI assistance systems, such as GitHub Copilot and ChatGPT, to improve coding efficiency and solve programming challenges.
- The students manage text documents using the vim text editor, employing advanced editing and configuration techniques.
- The students implement version control practices with Git to support collaborative software development workflows.
- The students program in C, focusing on syntax, data types, pointers, memory management, and use debugging and profiling tools like gdb, strace, ltrace, and gprof to analyse code performance.
- The students evaluate security aspects of system-related programming and apply protection mechanisms to ensure code security.

4. semester

Type of module

Compulsory module

Required prerequisites for the participation in the module according to the SPO

Mathematics knowledge from previous semesters ready for application

Recommended prerequisites for the participation in the module

Algorithmics, programming I and II (imperative or object-orientated), mathematics (algebra, analysis and stochastics), knowledge acquired in parallel from programming III.

Content

The course covers various mathematical and numerical problem-solving methods in theory and application. Either Python or MATLAB is used to implement the solutions.

The following mathematical topics are covered in theory and practice as examples:

- Numerical basics (floating point arithmetic, complexity of algorithms)
- Numerical solution of linear systems of equations (in particular matrix decomposition methods)
- Eigenvalue problems and their application
- Interpolation algorithms
- Numerical differentiation and integration
- Optimisation problems and algorithms (e.g. Newton method, gradient descent)
- Stochastic simulation and Monte Carlo methods

This is accompanied by an introduction to the numerical Python libraries (NumPy, SciPy, Matplotlib, possibly SymPy) or alternatively an introduction to the Matlab tool environment (Matlab as a programming language and development environment, vectors, matrices, data types, operators, maths functions, plots etc.). functions, plots etc.).

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

None

Examination - type

Other exam (soP) according to §§ 26, 27 APO

Examination - length/format

Portfolio

The concrete length/format of the examination will be determined in the study plan.

Learning outcomes

1. students know basic mathematical concepts and their implementation in Matlab.
2. students understand various mathematical methods that are relevant for solving practical, mathematically modellable problems.
3. students apply specific mathematical methods to solve computer science problems effectively.
4. students analyse mathematical problems and develop logical solution strategies for these problems.
5. students evaluate the suitability of various mathematical methods and their implementation in software development.
6. students create mathematical and algorithmic models to translate development problems into consistent mathematical problems.
7. students are able to use suitable mathematics software tools such as Matlab and other tools to support their problem-solving skills.
8. students develop their ability to work independently on scientific literature in order to expand their methodological competence.

Note: this module is an offer for the repeat examination for the portfolio performance of the course "Applied Numerics" from the previous summer semester. There is no regular course in the winter semester; the content is to be acquired by the students in self-study using the e-learning course from the summer semester. The above-mentioned attendance time is used exclusively to complete the portfolio work. Further information and detailed instructions on portfolio work can be found in the e-learning course for the summer semester.

Backend Systems

Content

- Introduction to Web Technologies: Basic building blocks of web development, including HTML for structuring web content, CSS for styling and layout, and JavaScript for adding interactivity and dynamic behaviour to web pages.
- Advanced JavaScript and Modern ES6+ Features: More details about JavaScript, exploring modern ES6+ features such as let, const, arrow functions, template literals, modules, promises, and async/await, and learn how to apply these in real-world scenarios.
- Fundamentals of React: Core concepts of React, including its component-based architecture, JSX syntax, and the use of state and props to manage data within components, enabling the creation of dynamic and interactive user interfaces.
- Advanced React Techniques: Advanced topics in React, such as the Context API for state management across the application, React hooks for managing state and side effects in functional components, and performance optimisation strategies.
- IT Security in Frontend Development: Principles of IT security as they relate to frontend development, including securing user input, preventing cross-site scripting (XSS) and cross-site request forgery (CSRF), and ensuring secure communication between frontend and backend systems. Introduction to the Open Web Application Security Project Top Ten list.
- Project Development and Deployment: Setting up development environments, following best practices in code organisation and documentation, and deploying and maintaining frontend applications in a production environment.

In the traditional degree programme, the lecturer provides or agrees with the topics of the practical examples for the examination. In the BIN dual study programme, the lecturer consults with the company on a task, ensuring practical relevance and feedback from the company.

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

Language of examination

English

Condition for the award of credit points

None

Learning outcomes

- The students understand the foundational principles of HTML, CSS, and JavaScript to build and style basic web pages effectively.
- The students apply modern web frameworks like React and Svelte to develop dynamic and responsive user interfaces.
- The students analyse different state management techniques, such as React hooks and the context API, to manage complexity in web applications.
- The students design cross-platform mobile user interfaces using Flutter, focusing on user experience and performance.
- The students implement best practices in frontend development, including version control, testing, and secure deployment processes.
- The students create a comprehensive frontend project from scratch, integrating all learned concepts into a fully functional application.
- The students evaluate different frameworks and tools for frontend development to make informed decisions based on specific project requirements.

Condition for the award of credit points

None

Learning outcomes

Students familiarise themselves with the basic concepts of business administration and are able to repeat them.

In the field of business administration, they will be able to understand the constitutive decisions of a company and analyse the business functions.

Students are able to understand and construct economic relationships.

Students are able to understand and correctly interpret economic texts (including those from business journals).

Algebra, Analysis, Algorithmics

Content

Automata theory and formal languages

- Automata
- Regular languages
- Context-free languages
- Context-sensitive languages
- General Chomsky Grammar

Computability

- Turing machines, non-deterministic Turing machines
- Programming language models of computation: GOTO programmes, WHILE programmes, LOOP programmes
- Mathematical calculation models: primitive recursion, -recursion
- Halting problem, undecidability, reducibility

Complexity theory

- Complexity classes: P and NP
- NP-completeness

Language of examination

German

Condition for the award of credit points

None

Learning outcomes

Students understand the basic concepts in the field of theoretical computer science.

Students understand the concepts of formal languages, automata theory, computability and complexity theory.

Students apply the skills they have acquired in abstract and theoretical thinking. The topics covered are highly abstract and thus promote the ability to think abstractly and theoretically.

Students translate theoretical concepts into practical solutions.

Software Engineering I

Programming 1 to 3

Content

This module builds on the Software Engineering I module and expands on many of the topics covered there. This includes advanced and quality-orientated activities in software development together with the associated concrete techniques and tools:

Principles and activities of the human-centred design (HCD) process

User experience and emotions

Creativity processes and techniques

Context of use analysis, requirements specification, interaction design, evaluation

Deepening and application of QA principles and measures using the example of HCD

Architecture: architecture principles, design patterns, architecture with UML

Build systems, continuous integration, continuous deployment

Design documentation and reviews

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

None

Examination - type

Written exam (sP) according to § 23 APO

Examination - length/format

90 minutes

The concrete length/format of the examination will be determined in the study plan.

Language of examination

Condition for the award of credit points

None

Learning outcomes

- Students learn relevant basic concepts and terms of HCI (usability, user experience)
- Students gain an overview of various lifecycle models of the human-centred design process
- Students learn why ensuring a positive user experience is important for product success and how this can be constructively ensured in a software development project
- Students learn the principles, methods and techniques of the early phases of the user-centred design process and can apply individual methods/techniques in practice (in particular context of use analysis/user research and requirements elicitation/documentation)
- Students learn principles, methods and techniques for creative brainstorming and designing interactive products
- Students learn principles, heuristics, methods and techniques for evaluating interactive products with regard to usability / user experience
- Students are able to carry out tests of user interfaces
- Students understand the principle of continuous integration
- Students are familiar with the concept of design patterns and can select and, if necessary, implement suitable design patterns for a given problem.
- Students are familiar with common architectural principles and can apply rudimentary design rules

Learning outcomes

The trainee should

- acquire relevant, practice-orientated knowledge of operational processes
- learn (through guidance) to work independently and autonomously in IT projects.
- combine competences acquired during their studies with practical experience.
- learn to understand problems and requirements (e.g. customer requirements).
- learn to design and implement solutions to problems (e.g. for company processes and/or IT projects).
- experience working in a team.
- get to know and experience embedding in the company, its processes and organisational procedures.
- get to know and experience the IT profession.
- learn to approach the right people when problems arise.
- learn about the unconditional will to successfully and professionally realise projects.
- experience excellence and professionalism.
- experience how employees are captivated.
- recognise and feel the meaning of their work.

Learning outcomes

1. students know the basic concepts of augmented reality (AR) and mixed reality (MR) and their areas of application.
2. students understand the differences between marker-based, image-based and location-based applications (LBS) in AR technology.
3. students use appropriate services to plan and realise AR applications.
4. students analyse requirements and possible uses for AR applications in relation to various content-based approaches.
5. students evaluate the effectiveness of different techniques for visualising content relative to spatial objects and markers.
6. students independently create AR applications that are both marker-based and image-based and can successfully publish them.
7. understand concepts for integrating AR applications into existing systems and services.

FWPM

Required prerequisites for the participation in the module according to the SPO

none

Recommended prerequisites for the participation in the module

A basic understanding of problem-solving skills such as simple excel calculations, creating graphs and charts along with preliminary idea on database concepts are sufficient.

Content

In this course, students will learn how to transform and visualise business data using Power BI, integrating advanced features such as AI-driven insights. Students will gain skills in data cleaning and modelling, designing interactive dashboards, and deriving actionable business insights. Through hands-on exercises, students will develop practical expertise in the following areas:

- Introduction to Business Data Visualisation: Power BI overview and setup, Navigating Power Query Editor.
- Data Transformation and Modelling for Analytics: Using Power Query for Data transformation, Relationships between Data models.
- Building Interactive Dashboards: Data preparation with Power Query, Basic visuals, usage of interactive elements: Filters, slicers, Drill-throughs, visualising data in business dashboards using Power BI.
- Incorporating AI Insights: Using Power BI's built-in AI insights: Influencers, Decomposition Tree and Q&A features.
- Case Study: Perform end-to-end analysis and create interactive dashboard on Stock Market Dataset to identify key trends, patterns, and actionable insights.

Examination

Presentation

The concrete length/format of the examination will be determined in the study plan.

Language of examination

English

Condition for the award of credit points

None

Learning outcomes

By the end of this course, students will be able to

- Demonstrate an understanding of the fundamental concepts of data analysis and its significance.
- Clean and transform data with Power Query ensuring well-structured data for analysis.
- Incorporate built-in AI features into Power BI to create effective dashboard visuals.
- Design and build interactive Power BI dashboards to communicate business insights effectively.

Content

Indicative content:

- Fundamentals of enterprise campus network design
- Network protocols and models
- Fundamentals of IP routing and switching
- IP addressing (IPv4/IPv6)
- Network security concepts and principals
- Configure and verify secure Inter-switch connectivity
- Implementing, optimising, and securing switched networks
- Implementing secure device access and access control systems
- Define key security concepts (threats, vulnerabilities, exploits, and mitigation techniques)
- Firewall Technologies

Learning outcomes

By engaging successfully with this module, students will be able to:

1. Explain the fundamentals of computer network and cyber security.
2. design, implement, configure, and troubleshoot high available secure scalable network infrastructures.
3. implement network security and access control solutions using routers, switches, and firewalls.
4. explain how vulnerabilities, threats, and exploits can be mitigated to enhance network security.

Literature

1. the students know the fundamentals of computer networks and cyber security principles.
2. the students understand the importance of securing network infrastructures against potential threats and vulnerabilities.
3. the students apply best practices in designing, implementing, configuring, and troubleshooting high-availability, secure, and scalable network infrastructures.
4. the students understand how threats and exploits can undermine network security and identify measures to mitigate these risks.
5. the students evaluate network security solutions, including access control measures implemented through routers, switches, and firewalls.
6. the students create comprehensive strategies to secure information assets and maintain robust network infrastructures based on theoretical knowledge and practical exercises.
7. the students develop the practical skills needed to prepare for the 200-301 Cisco® Certified Network Associate (CCNA®) exam, applying their learning to real-world scenarios.

Content

Have you ever wondered how self-service checkouts scan items, self-driving cars recognise pedestrians, computers detect skin cancer, and 3D models of iconic places like the Colosseum are scanned?

This module aims to answer these questions and many more by

- Giving an overview of the problems and approaches in computer vision, for applications as diverse as automation, robotics, medical imaging, and photogrammetry.
- Introducing the fundamentals of neural networks, required for constructing artificial systems with human-level perception capabilities.

The module spans from selecting the appropriate equipment for visual inspection tasks to image classification with convolutional neural networks and image retrieval with bag-of-visual-words models. The topics covered are:

01. introduction - nomenclature, history, state of the art, module logistics
02. image acquisition & digitisation - image sensors & representations, A/D conversion, Fourier transform
03. image enhancement - point operations, contrast adjustment, smoothing filters
04. feature extraction - edge detection, detection and description of local features
- 05 Segmentation and Morphology - Region growing, Hough transform, morphology operators
06. camera modelling - 3-D transformations, pinhole camera model, camera calibration
07. stereo vision - epipolar geometry, correlation methods, triangulation
- 08 Classification - Classifier evaluation, generalisation, nearest-neighbor, decision trees
09. ensemble methods - boosting and bagging, random forests, AdaBoost
10. neural networks - multi-layer perceptron, gradient descent, backpropagation

11. convolutional neural networks - Convolution and pooling layers, example architectures
12. bag-of-visual words - K-means clustering, TF-IDF, histogram comparison

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

Other exam (soP) according to §§ 26, 27 APO

Examination - length/format

Colloquium

The concrete length/format of the examination will be determined in the study plan.

Language of examination

English

Condition for the award of credit points

None

Learning outcomes

By the end of the module, students should be able to:

- Select appropriate camera systems and convert image representations, as well as discuss causes and avoidance of aliasing
- Implement and apply smoothing and morphology operators, edge detectors, and segmentation techniques
- Differentiate between contrast adjustment methods and compare the various approaches to detect and describe local features
- Determine and compute rigid body transformations. Specify camera models and project image and scene points.
- Determine epipolar geometries and lines. Calculate and discuss different correlation methods
- Assess and implement the various techniques for visualising and cleaning data for training classifiers
- Apply feature engineering and selection to classification tasks
- Differentiate between the quantities in the bias-variance problem and apply it to classifiers
- Assess, implement, and train neural networks and discuss their application to vision tasks

This module will be taught in English and delivered online and on campus. All sessions will be recorded. Colloquia can be done in English or German.

Content

Containerisation plays a very important role in today's enterprise software development and the cloud. In the course "Containerisation and Orchestration of Microservices", you will learn the basics of containerisation with Docker, create efficient microservice architectures and learn how Kubernetes works as an orchestration platform. From design and development to deployment, the practice-orientated course covers all aspects of microservices and enables students to prepare their knowledge for everyday working life. Through group projects and active participation, they are optimally prepared for the challenges of modern application development.

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

Mathematics I+II

Content

R

1. introduction to R (R Studio, packages,...)

2. R Basics (Names and values, Vectors, Control structures, functions,...)

Data Analysis

1. read in data with R

2. data visualisation with R (packages ggplot2, tidy, dplyr), histograms, boxplots,...

Labs: (Practical computer exercises): Read in Example Data-Files and graphical representation

3. basic data analysis with R

a. Visual Correlation Analysis

b. Effect measurements and parameter identification - Linear and Multiple Regression

Labs: Write your own book-recommendation engine in R

4. stochastic simulation

Monte Carlo Method in R with application to Measuring deviations from random pattern, Newcomb-Benford Law

Labs: Fraud detection: Read in manipulated data-file

Writing your own fraud detection programme and apply this program to the data

5. advanced data analysis with R

Face recognition with „eigenfaces" based on principal component analysis with R

Labs: Writing a program to recognise you own face

Examination

Recommended prerequisites for the participation in the module

- Interest in creative but challenging problem-solving approaches
- Entrepreneurial thinking
- Willingness to rigorously put your own ideas to the test

Content

In this course, the basic principles and background of innovation management and especially design thinking are explained and illustrated with clear examples. It is particularly important to convey to the participants that today's innovation processes place people at the centre and attempt to harmonise their customer needs with technical feasibility and economic efficiency. The students are given the first tools to organise and carry out simple design thinking innovation processes independently.

They need to understand which basic elements an innovation or design thinking process is based on and how these can be skilfully run through exercises. This makes it clear in a practical way what differences there are to the classic development process and what advantages a customer-centred approach offers, but also what disadvantages are associated with the DT approach.

The course is divided into two main modules:

1. a brief introduction to innovation management

Participants will gain an insight into common innovation models and processes, as well as the background and basic concepts of innovation research.

2. learning and going through Design Thinking yourself

Design Thinking is based on an iterative, customer-centred and playful problem-solving process that makes it possible to think outside the box in order to realise or strive for the previously unconsidered, seemingly impossible, possibly illogical and unattainable. In the course of this course, participants will go through a design thinking process and develop their own ideas as a project. The course is therefore designed to be interactive, which is why a high degree of proactive participation is expected. In return, participants can expect a course full of creativity, interesting discussions and crazy ideas.

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

Learning outcomes

1. students know the basic components of the design thinking process and can name them.
2. students understand the role of design thinking in the context of other innovation models and processes and can categorise them.
3. students apply methods of effective problem definition to identify relevant challenges in the innovation process.
4. students analyse the basics of user studies in the design thinking process and can explain their significance for solution development.
5. students evaluate innovation-relevant assumptions and hypotheses in order to be able to (de)construct them effectively.
6. students organise and conduct brainstorming sessions to generate creative ideas.
7. students create prototyping processes, describe them conceptually and can explain their practical application.

Content

The course aims to guide students in designing and building an e-commerce website over the course, applying principles of good user experience with a particular focus on theories and strategies related to emotional and persuasive design. During the course, students test each other's projects using various methods, such as interviews and observational studies, in addition to employing analytics tools to enhance their understanding.

- Core Principles of User Experience (UX) in E-Commerce
- Theories and Strategies of Emotional Design and Their Application in E-Commerce
- Persuasive Design Methods and Their Impact on User Behaviour
- Key Concepts of User Segmentation and Targeting Strategies
- Essential Strategies for Growth and Optimisation of E-Commerce Platforms
- Practical Development, Implementation, and Iterative Improvement of E-Commerce Websites

Learning outcomes

After completing the course, students will have a solid foundational understanding of:

- The fundamental principles of user experience (UX) in e-commerce and their practical applications.
- Emotional Design theories and strategies, and how to effectively apply them to e-commerce websites.
- Persuasive design techniques to influence user behaviour in digital environments.
- Qualitative and quantitative research methods, such as interviews and web analytics, and how they contribute to user-centered design.
- User segmentation and targeting strategies, allowing them to identify and reach different user groups effectively.
- Growth and optimisation strategies to enhance the performance of e-commerce platforms.
- The process of designing, implementing, and iteratively improving a fully functional e-commerce website.

Python, ML/AI basics

Content

This course provides a comprehensive understanding of Artificial Intelligence (AI) security, with a focus on ethical hacking principles, attacks on ML models and data, and defence strategies and techniques.

Students will gain theoretical and practical knowledge of key threats such as evasion, model extraction, model inversion, data extraction, data poisoning, backdoor attacks. How to provide attacks for testing purposes and what detection and protection techniques to use and how to use them.

Machine learning models such as Linear Regression, Support Vector Regression, K-Nearest Neighbours, Logistic Regression, Support Vector Machines (SVM), Decision Trees will be used.

Red and blue team scenarios will be used for practical exercises. Each student will play a role on both sides. The course will use several different scenarios for different attacks and machine models.

There is an example of a scenario for a red and blue team exercise focused on data poisoning and detection:

The company is developing a machine learning model to predict customer churn. The red team wants to reduce the accuracy of the logistic regression model by poisoning the data with label flipping. The goal of the blue team is to detect and mitigate the attack.

Red team tasks: Analyse the data set, develop the poisoning strategy, execute the attack, document the attack. The success of the red team is measured by the degree to which they degrade the performance of the model.

Blue team tasks: Establish a baseline (train a baseline model and evaluate the model's performance), Implement detection mechanisms - use techniques such as outlier detection (e.g. Isolation Forest), Mitigate the attack, Document the defence. The Blue Team's success is measured by their ability to detect and mitigate the attack and restore the model's performance.

Both teams will be judged on the clarity and thoroughness of their documentation and presentation of their findings to the whole group

of students, showing and commenting on their Python code and explaining their strategies.

Tools for coding: Jupyter Notebook environment for Python (scikit-learn, pandas, numpy, matplotlib, seaborn), e.g. Google Colab.

By the end of the course, students will work in teams to formulate responsible AI security testing methodologies that meet ethical and legal standards. They will discuss and evaluate the ethical implications of AI vulnerabilities and develop a set of ethical guidelines for AI security and ethical hacking.

Learning outcomes

After successfully completing the course IT Risk Management

- know the regulatory requirements for IT risk management,
- structure the process of IT risk analysis and successfully identify IT risks,
- be able to select and apply quantitative and qualitative methods for identifying and analysing risks depending on the situation,
- know how IT risks can be assessed,
- understand how standard software can be used to implement efficient IT risk management.

Required prerequisites for the participation in the module according to the SPO

none

Recommended prerequisites for the participation in the module

none

Content

This module introduces the core ideas and the basis techniques of machine learning. It covers theory, algorithms and applications, focusing on real understanding of the principles of inductive learning theory and of several machine learning techniques.

- Concept Learning
- Decision Tree Learning
- Bayesian Learning
- Artificial Neural Networks
- Support Vector Machines

Phyton is the programming language used in this module but prior knowledge of Python programming is not required. Students will gain all required knowledge in a step-by-step fashion, through examples.

The module complements courses on data management and data processing by teaching machine learning algorithms to analyze data.

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

None

Examination - type

Other exam (soP) according to §§ 26, 27 APO

Examination - length/format

Colloquium

The concrete length/format of the examination will be determined in the study plan.

Language of examination

English

Condition for the award of credit points

None

Learning outcomes

Students will:

- develop a basic understanding of the field of machine learning and theory behind it.
- acquire theoretical knowledge about the most effective machine learning techniques.
- identify basic theoretical principles, algorithms, and applications of machine learning.
- identify and compare different solutions based on machine learning techniques.
- apply different techniques to improve the results.
- learn how to evaluate the performance of machine learning algorithms.
- gain the practical know-how needed to apply machine learning techniques to practical problems.
- know how to code a machine learning algorithm in python using machine learning library scikit-learn.
- apply machine learning techniques in developing practical projects.

Basic knowledge in programming (Python) and mathematics (linear algebra, analysis).

Content

Over the last few years, artificial intelligence (AI) has profoundly changed the way we process information and make decisions, both in our personal and professional lives. A thorough understanding of the principles underlying AI is therefore a critical skill in many industries.

This course serves as a broad introduction to AI and its subfields. We are going to discuss - from scratch - the design, training, and operation of an AI system. Motivated by intuitive concepts and visual insights, we are going to introduce a technical framework that allows us to express the fundamental building blocks of an intelligently operating system (e.g., an autonomous robot). Such a system needs to:

- Organise task-dependent data and use this data to make predictions.
- Understand its environment by connecting sensory information to physical location.
- Interact with its environment by planning routes and manipulating objects.

The course will be accompanied by small coding projects in Python that demonstrate the application of these concepts in a series of practical scenarios.

In particular, the course covers the following topics:

[The State of AI] Historical developments, emerging trends, and open questions

[Tools & Techniques] AI-assisted productivity & creativity

[The AI Pipeline] From hard-coded rules to learned decisions

[Data] Collection, representation, and analysis of data

[Hello World] Algebraic, analytical, and statistical foundations of AI

[Supervised Learning I] Data-driven models of reality: classification and regression

[Supervised Learning II] Data-driven models of reality: model complexity and regularisation

[Unsupervised Learning] Finding patterns without annotations

[Reinforcement Learning] No data, no problem: learning actions from interactions

[From Perception to Action I] Visual AI: understanding information in images

[From Perception to Action II] Visual AI: localising information in images

[From Perception to Action III] Embodied AI: manipulating environments

[From Perception to Action IV] Embodied AI: navigating environments

[Guest Lecture] Industrial applications of AI in the automotive industry

[AI & U] Working with and contributing to the future of AI

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

None

Examination - type

Written exam (sP) according to § 23 APO

Examination - length/format

90 minutes

The concrete length/format of the examination will be determined in the study plan.

Language of examination

English

Condition for the award of credit points

None

Learning outcomes

- The students understand the structure of the AI landscape, including its different subfields and how they are connected.
- They can express industry tasks as learning problems (supervised, unsupervised, reinforcement) and select an appropriate AI framework for the type of data at hand. - They are familiar with the individual components of the selected AI framework - (1) data acquisition and representation; (2) model specification and optimisation; and (3) performance evaluation and analysis - and can set up and execute this pipeline.
- The students understand the role of embodied AI and the challenges and solutions that come with it, such as perception, kinematics, and navigation.

Good programming skills (e.g. from Programming 1 and 2, Web Programming 1 to 3) or similar.

Recommended prerequisites for the participation in the module

none

Content

This module introduces software development of mobile devices. The Android operating system and/or iOS will be used in the course. The development environment will be Flutter on Android Studio or VS Code. Dart will be used as the programming language. No prior knowledge of Dart programming is expected, but a good understanding of other languages (e.g., Java, Python, or JavaScript) is required.

Introduction to Dart Programming

- Short Overview of Flutter: History, advantages, and architecture.
- Introduction to Dart programming language.
- Setting up the development environment.

Introduction to Flutter - Flutter GUI development

- Understanding widgets and basic UI elements.
- Understanding Stateful and Stateless widgets.
- Layout widgets: Row, Column, Stack, etc.
- Basic interaction elements: Buttons, sliders, and switches.

Navigation and State Management

- Navigation patterns: push/pop navigation, named routes.
- State management basics: setState, Provider.
- Implementing forms and user input handling.

Working with External Data

- Fetching data from the internet (APIs).
- JSON serialisation and deserialisation.
- Firebase

Integrating Device APIs like Location and Camera

- Introduction to Device APIs in Flutter.
- Implementing location services: getting and using GPS data.
- Accessing and using the camera: taking pictures and video recording.
- Permissions handling for location and camera.

Testing Advanced Features and Best Practices

- Animations and transitions.
- Using custom fonts and assets.
- Best practices in Flutter development.
- Testing Flutter Apps

Examination

Condition for the award of credit points

None

Learning outcomes

- The students understand the fundamentals of mobile application development using Flutter for Android and iOS, focusing on professional programming practices.
- The students apply concepts of asynchronous programming and thread management to handle complex tasks in mobile applications efficiently.
- The students analyse architecture concepts for mobile solutions, including the distribution between client and server and communication protocols for mobile devices.
- The students design mobile user interfaces based on reusable software components, ensuring an intuitive and consistent user experience.
- The students implement mobile applications that integrate sensor data evaluation and server communication, following best practices in mobile development.
- The students evaluate different mobile architecture approaches and technologies to choose the most suitable solutions for specific application requirements.
- The students create a fully functional mobile application for Android or iOS, including publishing and deployment.

Learning outcomes

- Students understand the job description of "penetration tester" or "security researcher" and know the process of penetration tests
- Students know popular classes of vulnerabilities in web applications and classic applications and can exploit them
- Students understand so-called post-exploitation strategies and lateral movement strategies in networks that have already been infiltrated
- Students know the legal basis and framework conditions for carrying out penetration tests
- Students can systematically evaluate potential vulnerabilities, categorise them based on standards and present them
- Students are able to develop appropriate countermeasures to close vulnerabilities

Content

You will learn the fundamental methods for endowing aerial autonomous drones with perception, planning, and decision-making capabilities. You will learn algorithmic approaches for robot perception, localisation, and simultaneous localisation and mapping, as well as the control of non-linear systems, learning-based control, and aerial drone motion planning. You will learn methodologies for reasoning under uncertainty.

On day one, you will learn to describe the basic control loop of an autonomous robot. You will explain the basics of drone locomotion and kinematics (how drones move). On day two, you will learn to enumerate the purpose of sensors on a drone. You will explain the structure and applications of Bayesian filters. On day three, you will learn to implement a simple localisation system. On day four, you will learn to explain behavior trees as a formalism to describe drone behaviour. You will learn to define principles of planning algorithms (Dijkstra's Algorithm, A* Search, D* Search). You will apply reinforcement learning to solve drone planning problems.

You will design a simulation in Robot Operating System 2 (ROS2) for demonstrations and hands-on activities.

Learning outcomes

1. the students know the fundamental principles of motion control applied to aerial autonomous drones.
2. the students understand basic concepts of perception, distinguishing between classic approaches and deep learning methods for robot perception.
3. the students can explain principles of localisation and Simultaneous Localization and Mapping (SLAM), including their importance for autonomous navigation.
4. the students analyze navigation algorithms, focusing on planning and decision-making processes necessary for effective drone operation.
5. the students apply algorithmic approaches for robot perception, localisation, and planning in practical scenarios.
6. the students implement learning-based control techniques for aerial drones to enhance their motion planning capabilities.
7. the students utilize the Robot Operating System (ROS) in demonstrations and hands-on activities, reinforcing the theoretical concepts covered in the course.

Content

The project work is usually teamwork (at least three students). It involves either end-to-end software development according to the rules of software engineering or another task from the IT field (e.g. software comparison, software selection, software introduction). Each project is supervised by a professor from the Faculty of Computer Science and Business Informatics. As part of the project work, learned techniques and methods of computer science are practised in a practical professional context (teamwork; project organisation; practical tasks).

The topics of the practical examples for the examination are provided by or agreed with the lecturer in the traditional degree programme.

In the BIN dual study programme, a practical task is worked on in consultation with the lecturer. This ensures practical relevance and feedback from the company.

Students are instructed to independently develop software and create documentation consisting of the following parts:

- Software development
- Requirements specification, in which the requirements for the project work are compiled (with milestones/schedule)
- Technical design using appropriate methods
- IT design
- Listing
- User manual
- Appendix (literature used; list of abbreviations, glossary, etc.)
- For other tasks:
- Project description in which the requirements for the project work are summarised (with milestones/schedule)
- Further contents to be specified by the supervising professor, which result from the individual character of the respective assignment
- Appendix (literature used; list of abbreviations, glossary, etc.)

Learning outcomes

- Understand the importance of RE for software development
- Gain knowledge of common RE models and methods
- Ability to select and apply different requirements elicitation techniques
- Ability to analyze requirements (negotiation, prioritisation)
- Ability to model and structure requirements based on UML and other modelling techniques
- Ability to model textual Use Cases, Use Case diagrams and non functional requirements
- Ability to specify requirements using (structured) natural language (use cases, scenarios, user stories)
- Ability to validate requirements against quality criteria for requirements
- Knowledge of stakeholder analysis and ability to perform basic stakeholder analysis
- Selection and planning of appropriate RE methods for different case studies and scenarios
- RE in International projects
- Understand (and practice) relevant skills
- Understand the specialities of Requirements Engineering in machine learning context
- Ability to apply Requirements Engineering techniques for machine learning applications
- Ability to adapt Requirements Engineering techniques for generative artificial intelligence based systems

Content

In this seminar, students are given the opportunity to deal individually with various aspects of machine learning. From a selection of topics, they choose those that correspond to their interests and strengths. The topics range from programming tasks to theoretical questions.

At the beginning of the semester, basic knowledge of machine learning is taught, which is then deepened and expanded by the students in the form of presentations. Current approaches in various disciplines such as computer vision are covered. In addition to the technical discussion, great emphasis is placed on the development of soft skills.

The basics of presentations are introduced in order to prepare students for the presentation of their topics. The aim is to train not only subject-specific knowledge, but also presentation and communication skills.

Examination

Learning outcomes

Specialist specialisation:

- Acquisition of basic knowledge in the field of machine learning
- Specialisation in a selected topic from a variety of current disciplines, such as computer vision
- Understanding of modern approaches and methods in machine learning, both on a theoretical and practical level

Methodological competences:

- Ability to familiarise oneself independently with machine learning topics
- Development and structuring of scientific presentations
- Critical analysis of current research results and approaches

Social and communication skills:

- Confident and goal-oriented presentation in front of a group
- Communicating complex content in an understandable way
- Receiving and integrating feedback to improve your own performance

Personal development:

- Developing skills to communicate technical content clearly and effectively
- Training self-confidence in dealing with scientific topics and discussions

Programming I, Programming II, Programming project/software development project

Content

This module deals with different types of tests and their application in software development. The SOLID principles and the 4-layer concept for test architectures are taught. It also covers the automated testing of interfaces and APIs as well as the use of mocking. Another focus is on behaviour-driven development with Cucumber. Exploratory testing and the integration of automated tests into a DevOps life cycle are also discussed. The module includes practical content for which a virtual machine is provided. The prerequisite for this is the installation of VirtualBox.

- Fundamentals of testing (test coverage, test paths, black box, white box, grey box, functional and non-functional tests, test pyramid)
- Test automation (goals, success factors, differences between different types, test framework JUnit, annotations, assertions, exception testing, parameterisation, test types, record replay, scripted testing, keyword-driven testing)
- Test architecture (SOLID principles, 4-layer concept, test modelling layer, test definition, test execution, test adaptation, interfaces, design and development, important design patterns for testing)
- Testing of graphical user interfaces (introduction to Selenium, drivers, PageObject patterns, identifiers, waits, cookies)
- Mocking (Wiremock)
- Behaviour Driven Development (Feature Files & Step Files, Cucumber & Gherkin, Parameters, Data Tables, Scenario Outlines and Background, Runner Classes)
- Exploratory testing (methods and techniques)
- Build Server (Jenkins basics & DevOps basics, gPipelines, DevOps process from a testing perspective)

Content

The transfer colloquium serves the exchange of students in the dual study programme variant and replaces one of the FWPM. Students on the normal version of the degree programme do not take part in this event. The event takes place over the third to seventh semester, with the exception of the practical semester. Under the guidance of a lecturer, the dual study programme students discuss the following topics:

- Introduction and overview: Presentation of the transfer colloquium and its objectives, explanation of the importance of the exchange of experience between the university and company for dual students.
- Reflection on practical experience: In-depth reflection on the knowledge and skills acquired during the programme and in practice, as well as their application in everyday working life.
- Exchange of experience: Moderated discussions on challenges and solutions in the coordination between university studies and practical work in the company.
- Best practice examples: Presentation and discussion of successful projects and practices from the company that have been implemented by students in their studies and in practice.
- Problem-solving strategies: Development and presentation of solutions to typical problems that can arise in dual studies, including time management and prioritisation.
- Application of theoretical knowledge: Deepening the understanding of how theoretical knowledge from the university modules can be practically applied in the company.
- IT security in the company: Introduction to the importance and implementation of IT security measures in practice, based on theoretical principles and practical applications.
- Project documentation and presentation: training in the creation and presentation of project documentation in order to present the work carried out in the company in a structured manner.
- Feedback and continuous improvement: Systematic collection and analysis of feedback from companies and the university to continuously improve the dual study programme.
- Professional development and career planning: Discussion of career paths and development opportunities for dual study programme

students, based on the skills acquired during their studies and in practice.

Learning outcomes

- Students systematically reflect on their practical experience in order to draw conclusions for their professional development.
- Students develop strategies for solving problems that arise in the coordination between study and practice.
- Students apply the theoretical knowledge they have acquired in practice in the company in order to optimise the transfer of knowledge between university and practice.
- Students communicate their practical experience in a clear and structured manner and present their results effectively.
- Students evaluate the importance of IT security in the corporate context and implement appropriate measures in their daily work.
- Students create professional project documentation to make their work transparent and comprehensible.
- Students use feedback constructively to continuously improve their working methods and the cooperation between the university and the company.

<https://kurse.vhb.org/VHBPORTAL/kursprogramm/kursprogramm.jsp?kDetail=true&COURSEID=18586,81,816,1>

In our highly technical and networked world, the usability of products, services and interactive systems is becoming an increasingly important feature for users and users on the one hand and a competitive advantage for manufacturers on the other. With a comparable range of functions, many products are being offered at increasingly favourable prices in global competition. The user has a choice and will opt for the advantages of a product that has been tested and optimised for usability and user experience. By using usability engineering methods, manufacturers can meet these requirements and develop unique selling points for their products. Usability and user experience objectives should therefore be considered as early as possible in the development process and implemented using suitable methods, among other things to avoid costly misdevelopments and increase the benefits for customers. Prospective engineers and computer scientists must be able to recognise this problem and know in which phases of product development suitable methods are used.

Learning outcomes

This is an offer of the Virtual University of Bavaria. Further information can be found at

<https://kurse.vhb.org/VHBPORTAL/kursprogramm/kursprogramm.jsp?kDetail=true&COURSEID=18586,81,816,1>

Naming the content of the analysis phase in usability engineering.

- Independent application of analysis methods and techniques of usability engineering
- Application-specific identification of relevant parts of the DIN/ISO 9241 series of standards
- Describe and apply terms (usability) and principles (dialogue design)
- Describe and apply a process for designing usable interactive systems
- Describe the essential aspects of cognitive psychology and industrial psychology
- Identify and name criteria for evaluating colour design in order to identify and name associated usability problems.
- Describe fundamental aspects of contrasts and their use in design.
- Recognise in which development phases design laws must be observed and how these simple laws help to identify usability problems
- Apply design laws in a targeted manner in the context of usability evaluations
- Describe the typical procedure in interface and interaction design.
- Name different types of prototypes and describe their function in usability engineering
- Describe and apply usability metrics from the areas of "Usability Performance Metrics" and "Usability Issue based Metrics".

Concentration module

Required prerequisites for the participation in the module according to the SPO

120 ECTS credits,, Course 5X02530

Recommended prerequisites for the participation in the module

Linear algebra, knowledge of C++

Content

Theoretical topics

- Mathematical basics of computer graphics
- Fundamentals of physically motivated lighting
- Ray tracing

Algorithmic topics

- Overview of basic computer graphics algorithms
- Lighting
- Texturing
- Shadows
- Volume rendering

Practice orientated topics

- Computer graphics with OpenGL
- Realisation of ray tracing
- Shader programming

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

Condition for the award of credit points

None

Learning outcomes

Students expand and deepen their knowledge of computer graphics and acquire the skills to analyse and structure complex tasks.

Students understand tasks in the field of computer graphics, analyse them and develop solutions.

Students apply their knowledge in practice within the scope of their tasks.

Students realise high-performance computer graphics applications.

Students understand the mathematical principles of computer graphics.

Recommended prerequisites for the participation in the module

none

Content

In this module, students gain an in-depth insight into mobile application scenarios and business models.

They gain the necessary knowledge of operating platforms and architecture concepts for mobile business applications.

Integration aspects (ERP integration) of mobile solutions and communication paradigms (SOA, REST, SOCKETS) are also covered.

Another important point is the development using cross-platform development (HTML5).

Examination

120 ECTS credits, course 5102530

Recommended prerequisites for the participation in the module

Programming I + II, Fundamentals of Computer Engineering, Computer Architecture, Operating Systems, Algorithms & Data Structures

Content

- Introduction to C for programmers
- Specifics of programming microcontrollers (AVR8 controller)
- Memory model, interrupt concept
- Hardware structure and programming of common interfaces for communication and control of peripherals such as U(S)ART, SPI (Four Wire), I²C (Two Wire), OneWire, CAN
- Programming of peripheral devices such as SD cards, EEPROMs, digital sensors: IMU (10-axis), digital thermometers, ultrasound, ...
- Programming of wireless interfaces (RF) such as Bluetooth and WiFi for controlling applications such as servos using a smartphone
- Introduction to a current, application-based development environment (ARM Cortex family)

Examination

Condition for the award of credit points

None

Learning outcomes

Ability to formulate complex problems

- Students describe and solve problems from the area of the seminar.
- Students apply the necessary basics of computer science and mathematics to work through the seminar topics.

Selection and safe application of suitable methods

- Within the scope of their tasks, students select methods they have learnt and acquire additional confidence in their application

Knowledge of practically relevant tasks

- Students understand the techniques and methods used in the seminar as part of their assignment.

Ability to present and document results in a comprehensible manner

- Students present and demonstrate their results in the seminar.
- Students generalise their ability to expand existing knowledge independently: Students understand and explain content and apply this to deepen and expand content independently.

Expertise in recognising significant technical developments

- The seminar topics deal with current and future-oriented technologies and methods. Students understand and discuss the state of the art.

Learning outcomes

Learning objectives: By dealing with a selected topic, the ability to deal with challenging topics is deepened.

- The students acquire mathematical and technical basics
- Derive the specialised knowledge required for their specific topic or area of application
- Implement this knowledge using the methods they have learnt and acquire additional confidence in their application

The findings are documented and the results are presented at the end of the seminar

- Students acquire the skills to document and present results in a comprehensible manner.
- Students apply methods of scientific work including (literature) research.
- Students generalise their ability to independently expand existing knowledge and quickly familiarise themselves with the topics of others (fellow students)

Literature

- Will be announced in each case.

Condition for the award of credit points

None

Learning outcomes

After participating in the module, students can independently plan, realise and set up VR applications or publish them using appropriate services.

Game engines are used to create VR environments. Students therefore learn the basics of importing and operating geodata in game engines, as well as the settings for rendering and preparing the data for VR applications, including programming controllers and the interface to VR glasses.

Recommended prerequisites for the participation in the module

Linear Algebra

Content

In this module, students learn about the basic concepts and methods of artificial intelligence (AI) and specifically apply them to information security issues.

First, various classification strategies -- such as Naive Bayes or neural networks -- are introduced, and their possible applications in a security context are explained. In practical exercises, students develop and train their own models, e.g. for the automated detection of phishing emails or attacks in network traffic.

Another component of the module is the critical examination of the use of AI by attackers.

Here, application scenarios are discussed in which AI is used to improve digital attacks, for example to optimize social engineering strategies or to generate deceptively authentic content.

Finally, students deal with issues concerning the security and privacy of AI systems themselves.

Among other things, forms of attack such as data poisoning, adversarial examples, and backdoors are discussed, which can be used specifically to manipulate AI models.

The aim of the module is to develop a sound understanding of the responsible and security-conscious use of AI in cybersecurity.

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

None

Examination - type

Other exam (soP) according to §§ 26, 27 APO

Examination - length/format

Portfolio

The concrete length/format of the examination will be determined in the study plan.

Language of examination

English

Condition for the award of credit points

None

Learning outcomes

- Students know the basics of artificial intelligence and at least two classification strategies (e.g., Naive Bayes Classifier, neural networks).
- Students can analyse a given application scenario and accordingly select and use suitable models (e.g., using Python).
- Students can train their own models with suitable data (incl. pre-processing) and evaluate the results.
- Students recall various scenarios in the field of information security in which AI models are already being used successfully and understand how.
- Students understand the fundamental security-related problems of AI models. They can apply corresponding attacks and basic defences.

Databases, Databases I, Backend Systems

Content

As part of this module, students acquire practical and interdisciplinary skills in the field of modern database management. The content taught is designed to combine technological fundamentals with current requirements from practice and research.

The following aspects are covered in particular:

- In-depth examination of the CAP theorem with consideration of real distributed database systems.
- Systematic selection of suitable database management systems (DBMS) on the basis of concrete application scenarios. This includes both relational (e.g. PostgreSQL, MySQL, SQL Server, Oracle) and non-relational systems (e.g. MongoDB, Redis, Riak).
- Use of a data modelling tool (e.g. erwin Data Modeler) to create conceptual and physical data models.
- Use and evaluation of monitoring and performance tools, in particular with regard to load distribution, system monitoring and analysis of query execution plans.
- Investigating different fragmentation strategies for the efficient storage and management of large amounts of data in distributed database systems.

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

None

Examination - type

Other exam (soP) according to §§ 26, 27 APO

Examination - length/format

Portfolio

The concrete length/format of the examination will be determined in the study plan.

Language of examination

German

Condition for the award of credit points

None

Learning outcomes

- Students recognise basic concepts, terms and architectures of relational database systems.
- Students understand the structure and functionality of various database management systems (DBMS).
- Students apply relational modelling techniques to create conceptual data models (e.g. ER diagrams).
- Students analyse requirements for database systems in order to select suitable technical solutions.
- Students evaluate simple database designs with regard to freedom from redundancy, normalisation and performance.
- Students create relational database schemas using suitable modelling and implementation tools.

Learning outcomes

- Students can identify the prerequisites of current agile concepts based on different company models, explain their practical effects and assess key success factors in their application.
- Students can confidently name terms and methods of agile concepts, explain their meaning, apply them to specific situations and differentiate between different approaches.
- Students can explain agile values and principles, analyse their relevance in typical project situations and critically evaluate typical conflicts and contextual factors.
- Students can plan and apply Scrum and related agile methods in a project context, orchestrate their process components and formulate and evaluate the effects on results.
- Students can implement DevOps practices in development, plan and execute continuous integration, delivery and deployment in the project and critically assess efficiency, quality and risk.

Recommended prerequisites for the participation in the module

Courses on computer networks and communication (e.g. internet communication, backend systems), algorithms and data structures, operating system basics

Content

Introduction/recap regarding of communication models for distributed systems

- Remote procedure calls
- Blackboards and Event-based models

Fundamentals for distributed algorithms

- differences between algorithms in distributed systems, parallel algorithms and single machine algorithms
- consensus problems
- failure models
- physical clocks and logical clocks

Algorithms for

- coordination
- leader election
- searching
- failure tolerance / failure handling
- consistent data replication

The course will be given in English.

The course is programming language agnostic, students can choose their preferred languages to implement seminar assignments.

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

none

Examination - type

Other exam (soP) according to §§ 26, 27 APO

Examination - length/format

Portfolio

The concrete length/format of the examination will be determined in the study plan.

Language of examination

English

Condition for the award of credit points

none

Learning outcomes

After completing the course students are able to

- understand the capabilities and limitations of distributed systems,
- explain different failure models,
- utilise remote procedure call frameworks to program in distributed systems,
- design and implement solutions to common problems in distributed systems,
- choose algorithms to handle conflicts and failures in distributed systems,
- discuss the major challenges in distributed systems both in general and for specific tasks,
- compare different algorithmic solutions to common problems in distributed systems and discuss potential trade-offs

Content

Part I: Automotive Cybersecurity

Introduction to Automotive Cybersecurity

- Architecture of Modern Vehicles
- Cybersecurity Challenges of Modern Vehicles and E/E Architectures

Legislation and Standardisation for Cybersecurity in the Automotive Industry

- Introduction to Automotive Cybersecurity Regulations and Standards: UN ECE WP.29 and the UN Regulations No. 155 and 156, Vehicle Type Approval, Overview of Global and European Approach
- Introduction to the International Standard ISO/SAE 21434
- Related and Upcoming Standards

Automotive Threat Analysis and Risk Assessment (TARA) According to ISO/SAE 21434

- Introduction to Risk Management and TARA
- Scope of a TARA, Attacker Model, Item Definition
- Asset Identification (Typical Assets for Automotive Embedded Systems)
- Cybersecurity Properties (CIA Triad and Other Properties)
- Definition of Damage Scenarios
- Identifying Threats: Overview of Threat Modelling, STRIDE, Brainstorming, MITRE ATT&CK, OWASP
- Definition of Attack Paths: Identification and Description of Attack Paths, Attack Trees, Vulnerabilities
- Attack Feasibility Evaluation
- Risk Evaluation
- Risk Treatment Decision: Cybersecurity Goals
- Cybersecurity Claims, Typical Controls for Automotive Embedded Systems

Part II: Industrial Cybersecurity

Introduction to Industrial Networks and Control Systems

- Industrial Security, Basic Process Control Systems, Differences Between IT and OT Systems

- Components and Architecture of Industrial Control Systems: Field Devices, Programmable Logic Controllers, Distributed Control Systems, Supervisory Control and Data Acquisition (SCADA) Systems, Network Transmission Media, Field Device Architecture, Industrial Network Protocols, Enterprise Network Protocols, Industrial Safety and Protection Systems, Safety Instrument Systems (SIS), OT/IT Network Integration, Purdue Reference Model

Industrial Cybersecurity and Secure OT Architectures

- Introduction to Cybersecurity Challenges in the Modern Industry (Industry 4.0): Examples of Attacks, MITRE ATT&CK Database, SHODAN
- Overview of Relevant EU Cybersecurity Regulations: NIS2, Cyber Resilience Act (CRA), Regulation on Machinery, Radio Equipment Directive (RED)
- Secure OT Architecture: Boundary protection, Firewalls, Industrial Demilitarised Zone, Proxies, Network Zoning, Data Diode, Zero Trust Architecture (ZTA)

The International Standard IEC 62443

- Overview of the International Standard ISA/IEC 62443
- Basic Terminology
- Security of Industrial Networks: Security Programme, The Automation Solution Security Lifecycle, Security Levels and Maturity Levels, Security Objectives and Foundational Requirements, Defense-in-Depth Principle, Threat-Risk Assessment, Security Zones and Conduits
- Security of Products: Risk-based Approach and Relation to Cyber Resilience Act, Security Levels and Functional Requirements, Secure Development Lifecycle

Examination

Learning outcomes

- Students understand the architecture and cybersecurity challenges of modern vehicles, including the basics of E/E architectures.
- Students know the essentials of risk management and threat modelling, including terminology, standards, and methods for conducting threat analysis and risk assessment (TARA) in both automotive and industrial contexts.
- Students know fundamental cybersecurity protection concepts for industrial control systems (ICS), understand the differences between OT and IT, understand terminology and concepts of the IEC 62443 standard, and are aware of relevant guidelines and new European regulations.
- Students are capable of performing comprehensive threat analysis and risk assessment (TARA) for automotive systems and industrial/operational technology (OT) environments, identifying vulnerabilities, and evaluating risks.
- Students are able to manage and develop the work products of automotive development projects in accordance with the international standard ISO/SAE 21434.
- Students can design and implement secure network architectures for industrial systems, applying principles such as zoning, Zero Trust, and Defence-in-Depth.
- Develop analytical, structured, and logical thinking skills to systematically evaluate and address cybersecurity challenges in both automotive and industrial contexts.
- Enhance abstraction skills to understand and apply complex cybersecurity concepts, standards, and risk management techniques.

7. semester

Type of module

Compulsory module

Required prerequisites for the participation in the module according to the SPO

SPO 2019: 150 ECTS credits, courses in soft and professional skills, practical module, project work

SPO 2023: 120 ECTS credits from the first two years of study, practical module, professional skills, project work

Recommended prerequisites for the participation in the module

none

Content

The Bachelor's thesis module consists of the Bachelor's thesis (12 CP) and the Bachelor's seminar (3 CP).

The Bachelor's thesis includes own studies and research on the state of the art in the respective subject area. In particular, the thesis must abstract from boundary conditions that are not technically based in nature, but result from the specific circumstances of the company/operation. If software solutions are required as part of the assignment, this generally means that prototypes are implemented as part of the Bachelor's thesis, but does not include ensuring product features (incl. accompanying manuals, etc.).

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

None

Examination - type

Other exam (soP) according to §§ 26, 27 APO

Examination - length/format

Thesis, Presentation

The concrete length/format of the examination will be determined in the study plan.

Language of examination

German/English

Condition for the award of credit points

None

Learning outcomes

With the Bachelor's thesis / Bachelor's seminar, the student demonstrates that he/she is capable of independently solving a challenging task in the field of computer science (possibly interdisciplinary), that he/she has mastered the methodological and scientific principles of the subject and can adequately present the result.

Students from the dual study programme are assigned a topic related to the respective partner company. The task is set by the supervising professor at THWS.

Literature

depending on the topic; the Bachelor's thesis should be written scientifically, i.e. literature must be intensively analysed, used and cited according to the topic.

Type of module

FWPM

Required prerequisites for the participation in the module according to the SPO

none

Recommended prerequisites for the participation in the module

- Basic programming knowledge (Java/Python)
- Prior exposure to databases and Linux recommended

Content

This comprehensive course provides an in-depth introduction to Big Data technologies, focusing on Hadoop and its ecosystem. Participants will learn core concepts such as the Big Data 4 Vs, analytics types, and Hadoop architecture, followed by hands-on programming skills with MapReduce, Hadoop Streaming, Pig, Hive, and Kafka. The modules combine theoretical knowledge with practical projects, including real-world case studies and an integrated data pipeline, preparing learners to handle large-scale data processing and analytics.

The course has the following content:

- Understanding Big Data concepts, including the 4 Vs and analytics types
- Overview of the Hadoop ecosystem and architecture components
- Programming with MapReduce using Java, including advanced techniques
- Developing Hadoop Streaming applications with Python/Shell scripts
- Exploring real-world case studies and mini projects for practical experience
- Data analysis with Pig Latin and scripting operators
- Building data warehousing solutions using Hive and HiveQL
- Learning Kafka architecture, topics, and data pipeline integration
- Hands-on exercises with HDFS, YARN, Pig, Hive, and Kafka
- Final project focusing on designing an end-to-end data processing pipeline

Examination

Learning outcomes

Upon successful completion of this module, students will be able to:

- LO1: Explain the fundamental characteristics of Big Data systems and analytics.
- LO2: Operate Hadoop HDFS and perform distributed storage and processing.
- LO3: Implement MapReduce programs using Java, including advanced features like distributed cache and joins.
- LO4: Use Pig Latin and HiveQL for high-level querying over large datasets.
- LO5: Demonstrate understanding of real-time streaming using Apache Kafka.
- LO6: Develop integrated solutions using multiple Hadoop ecosystem components.

Content

In this module, students gain deep insights into blockchain technology and smart contracts. After learning the basics, students are divided into teams to develop prototypes for suitable use cases. At the end of the module, students are able to evaluate use cases and implement them in practice.

The following content is taught to students:

- Evaluating use cases
- How blockchains work
- How the various consensus models work
- Introduction to contract-oriented programming
- Introduction to Solidity and suitable development environments
- Introduction to programming smart contracts
- Testing and debugging smart contracts
- Common design patterns for smart contracts
- Deployment and management of smart contracts
- Basics of decentralised applications (DApps)
- Frameworks for programming DApps
- Development of DApps
- Deployment of DApps
- Testing of DApps

Programming I/II

Content

The lecture teaches the basics of Jakarta EE (<https://jakarta.ee/>), also known under its predecessor name Java EE (EE: Enterprise Edition).

The focus of the course is on the creation of modern cloud native enterprise applications, divided into the following topics

- General requirements for business applications
- Web services (JAX-RS - Restful Web Services)
- Enterprise software patterns (CDI - Context and Dependency Injection)
- Data persistence (JPA - Java Persistence API)
- Use of microservice architecture patterns (via Microprofile <https://microprofile.io/>)
- Different runtimes (on-prem and cloud)

Most of the topics will be demonstrated and discussed directly using source code and live coding examples.

Examination

Learning outcomes

After successfully completing the module, students will be able to

- Differentiate between terms such as Java, Java EE and Jakarta EE and categorise buzz words from the Java Enterprise world.
- efficiently implement applications in different runtime environments based on the Jakarta EE APIs
- design and implement microservice architectures using Jakarta EE / Quarkus.
- use Docker in the Jakarta EE / Quarkus environment
- Analyse Docker cloud deployments.

Experience in the design and/or development of web applications (HTML, CSS, JavaScript)

Content

The event is divided into theoretical and practical parts, each with a specific focus on digital accessibility:

- Fundamentals of digital accessibility, design and development models
- Types of disabilities, assistive technologies and adaptation strategies
- Types and modes of action of barriers and allocation of responsibilities
- Relevant standards, norms and laws to support accessibility in the national and international environment
- Strategies for implementing accessible design & development processes
- Recognising, reducing and avoiding barriers in digital media: web, documents (e.g. MS Word, MS PowerPoint, PDF, e-book), audio-visual media (e.g. video, audio)
- Conception, design, implementation and testing of accessible web applications
- Setting up and working with screen readers and other assistive technologies

Examination

Learning outcomes

Students are familiar with various approaches to thinking and design that are associated with accessibility and are aware of their similarities and differences.

- They know the most common types of disabilities and are able to characterise the dominant models in society and science.
- They understand the demographic development and know the most important key figures on disabilities worldwide, in Europe and in Germany.
- You will be able to identify different types of barriers that occur when interacting with digital products. They will be familiar with assistive technologies and adaptation strategies for overcoming these barriers.
- They are familiar with the standards, norms and laws relevant to accessibility at various levels (world, Europe, D-A-CH) and know their interrelationships.
- They have internalised the advantages of accessible design on a personal, social and business level and know strategies for implementing and anchoring accessibility in organisations and development processes.
- They understand the barriers that can occur in various digital media (web, documents, multimedia systems, e-books, apps, software, terminals, etc.) and know principles, techniques and tools for recognising, reducing and avoiding barriers.
- They have in-depth knowledge of the conception, design and implementation of accessible web applications, can evaluate them for accessibility and are familiar with relevant testing tools and methods.
- They have the skills to check, evaluate and correct digital documents for accessibility and to create accessible documents independently.
- They know how to use common screen readers on different platforms and are able to set up a suitable test environment for testing web and other applications.

SAP user knowledge

Content

- What is SAP Business Technology Platform (SAP BTP)?
- History of SAP BTP
- SAP's strategy in the area of SAP BTP
- How is the BTP structured?
- What services does SAP BTP contain?
- Technical aspects of SAP BTP
- Overview of the areas of application of SAP BTP such as side-by-side extension, clean core, integration, analytics and AI, low-code / no-code
- Reference architectures with without S/4HANA

SAP BTP Customizing

- Basic customising
- Roles and authorisations
- Development of sample applications
 - o A first app in SAP BTP
 - o Configuring the work zone
 - o Clean Core with S/4HANA
 - o Setting up an integration scenario
 - o First integration of Generative AI

Examination

Learning outcomes

- 1) Students know the basic concepts and definitions of the SAP Business Technology Platform (SAP BTP) and its historical development.
2. understand the strategic importance of SAP BTP and its role in the context of a company's digitalisation strategy.
3. explain the structure and architecture of SAP BTP as well as the services it contains and their functions
4. apply basic customising techniques to adapt SAP BTP to specific application scenarios.
5. students analyse different areas of application of SAP BTP, such as side-by-side extensions, integration and analytics as well as low-code / no-code approaches.
6. students evaluate reference architectures of SAP BTP, including their integration with S/4HANA and the development of integration scenarios.

n/a

Recommended prerequisites for the participation in the module

Before the course unit, the learner/student is expected to be able to have basic computer networking, Linux, programming skills and ML/AI basics.

Content

This intensive Ethical Hacking learning programme focuses on ethical hacking techniques and practices. The programme in 2025 is oriented towards network and AI security, and typically covers topics such as attacks on AI systems, penetration testing, vulnerability assessment, IDS, Packet Analysis, various testing and hacking tools, and defensive strategies. Participants can expect hands-on training and real-world simulations to enhance their skills in ethical hacking. Team-based learning approaches will be used. The competition will take place at the end. By the end of the programme, participants should be equipped with the knowledge and tools needed to conduct ethical hacking assessments, identify security weaknesses, and recommend solutions to strengthen cybersecurity defences.

This course will be offered as a Blended Intensive Programme with several online sessions and a study trip to Kaunas, Lithuania.

Examination

Learning outcomes

- The students explain foundational ethical and legal principles of ethical hacking and organise effective teamwork norms.
- The students justify technical findings in clear oral and written presentations for diverse audiences.
- The students construct a controlled simulation environment (cyber range) to practice and test skills safely.
- The students analyse full packet captures with Wireshark to extract protocols, flows, and indicators.
- The students classify common cybersecurity attacks and select appropriate tools for safe reproduction and analysis.
- The students design basic penetration tests and interpret IDS outputs to assess detection and response.
- The students evaluate vulnerabilities in AI systems and propose defence strategies against adversarial attacks.
- The students plan a continuous-learning roadmap, selecting tools and resources that build knowledge and self-confidence.

Literature

Will be announced during class.

ISM Standards & Processes

Content

Many people and units inside and outside organisations are involved in the management of information security. Governance regulates how transparency, accountability and efficiency are ensured by defining structures, responsibilities and framework conditions, while at the same time safeguarding the interests of all stakeholders. This module shows which stakeholders are involved in information security management, how responsibilities are defined, decisions are made and optimal framework conditions for maximum information security are created.

The identification and assessment of IT risks helps organisations to deal with threats to information security in a targeted and structured manner. The risk-oriented approach is pursued in many ISMS frameworks (information security management system). The module teaches the basics of IT risk management, such as measures for identifying, analysing, assessing and handling IT risks in a structured risk management process.

In the section on ethics, essential conceptual foundations of moral philosophy are explained. On the basis of established schools of ethics, the normative justification of (information) security as a value and guiding principle is examined. The consideration of models for the integration of ethical considerations in development and system design processes builds a bridge to the application of ethical principles in practice. Questions of compliance with the applicable data protection law are also of particular relevance here. After an overview of its basic structures, the focus is on the requirements for technical and organisational data protection as well as the enforcement and consequences of legal violations. Finally, the basics of the reformed information security law are explained.

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

None

Examination - type

Written exam (sP) according to § 23 APO

Examination - length/format

90 minutes

The concrete length/format of the examination will be determined in the study plan.

Condition for the award of credit points

None

Learning outcomes

After completing the module, students will be able to

- name and specifically design basic governance mechanisms (e.g. responsibilities, guidelines, decision-making processes, committees) in the context of information security.
- describe relevant roles and stakeholders in information security management within and outside of organisations and differentiate between their tasks.
- explain the importance and function of IT risk management for information security and illustrate this using practical examples.
- identify and describe the organisational framework conditions for effective IT risk management.
- understand, apply and document a simple, structured IT risk management process.
- recognise ethical challenges in dealing with digital systems with security relevance and develop solutions for integrating ethical principles into work processes.
- explain the basic structures of data protection law and answer fundamental questions about data protection compliance.
- describe the main contents of information security law and assess their relevance for operational practice.
- communicate in a targeted manner with legal or regulatory experts on issues relating to data protection and information security law.
- reflect on the relationships between governance, risk and compliance management and ethics in security-critical IT environments.

Content

This module explores how sustainability principles can be integrated into the design, development, deployment, and management of IT systems. It offers a multidisciplinary perspective on the environmental, economic, and societal implications of information technology. Through lectures, case studies, and collaborative international projects, students gain both theoretical foundations and practical experience in Green IT strategies. Partnering with universities in the Czech Republic, Germany, and Iceland, the module includes cross-border collaboration and comparative analysis of regional IT sustainability approaches. This module contains a compulsory study trip to Prague, the Czech Republic.

- Introduction to Green IT: Definition, significance, and global relevance; real-world applications in industry and academia
- Environmental Impact of IT: Carbon footprint, e-waste, lifecycle analysis, and Green Computing standards
- Sustainable Software Engineering: Design principles and code optimisation for energy efficiency
- Green Algorithms and Data Structures: Techniques to reduce energy consumption and benchmark software for efficiency
- AI and Machine Learning for Green IT: Optimisation of energy use, environmental monitoring, and ethical implications
- Green IT Strategies in Mobile and Distributed Systems: Sustainable design and management of mobile technologies and data centres
- Life Cycle Assessment (LCA): Application of LCA in IT hardware and software development
- Education and Training for Green IT: Curriculum development, capacity building, and case studies
- Regulatory and Compliance Aspects: Overview of international standards, compliance practices, and green certifications

Examination

Learning outcomes

Upon successful completion of this module, students will be able to:

- Remember key concepts and terminology related to Green IT, including sustainability goals, environmental impacts, and regulatory frameworks
- Understand the ecological footprint of hardware and software systems and explain how IT contributes to global sustainability challenges
- Apply principles of sustainable software engineering, energy-efficient algorithms, and lifecycle assessments to practical use cases
- Analyse and compare national and regional Green IT strategies and regulatory approaches across Germany, Iceland, and the Czech Republic
- Evaluate the sustainability impact of IT systems and development practices using recognised metrics and standards
- Create innovative, practical solutions to real-world Green IT challenges by working on interdisciplinary, cross-national projects

"IT Project Management" or "Project Management" and

"Fundamentals of Economics" or "Fundamentals of Business Administration"

Content

This course consists of a two-day business game "Project Management" (SysTeams by RIVA) and a two-day business game "Strategic Management" (Global Strategy).

Structure:

I. Introduction to FWPM (organisational aspects),

II. part 1: "Project Management" block course

Content: Project management simulation game from SysTeamsProject by Riva.

The simulation game simulates a project management process from initial contact with the client to successful project completion. In small teams, the participants define, plan and control the project and also implement it themselves. Numerous project management tools are available for competent planning, e.g:

- Target plan
- work breakdown structure
- Milestone plan
- Gantt chart
- Project reports
- Risk analyses

The project is divided into several phases in which various project management tasks and work packages have to be completed, taking into account the available resources.

III Introduction "Strategic Management"

IV. Part 2: "Strategic Management" block course

Content: Global Strategy is an intensive general management simulation. Over the course of several rounds, participants develop a successful strategy for their company. The importance of strategic management for the company's success and business interrelationships are recognised and understood.

Contents and procedure:

- Profit and loss account, balance sheet
- Corporate and liquidity planning
- Costing
- Contribution margin accounting
- Cost management
- Break-even analysis
- Financing
- marketing
- investment appraisal
- Balanced Scorecard
- SWOT analysis
- Value-orientated corporate management
- Investment appraisal
- Balanced Scorecard
- SWOT analysis
- Value-orientated corporate management

Content

The module Social Engineering and Security Awareness focuses on the human factor of information security. People make a decisive contribution to information security in companies with their behaviour - they are an important security factor. Due to this influence, they are increasingly targeted by cyber criminals. The module primarily looks at these two aspects - security factor and victim - of the human factor in information security.

Information security awareness describes the sensitisation of employees for information security (security factor). The module contains the following contents on awareness:

- Concept and models, psychological understanding of awareness
- Practical examples of awareness measures
- Promoting and measuring awareness

Social engineering is the targeted manipulation of people in order to seduce them into unintentional actions (victims). The following contents, among others, are dealt with in social engineering:

- Basics and forms
- Psychological tricks
- Phishing and phishing simulations

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

Learning outcomes

Students see people as a solution and not as a problem for information security.

They explain the role of the human factor in information security using examples.

The students know and identify the principles of social engineering and can explain them using examples.

They name different forms of phishing and can discuss the advantages and disadvantages of phishing simulations.

They understand what information security awareness means and know methods to enhance the different aspects of awareness.

Students can create awareness measures in a targeted and individualised way.

Content

Based on an overview of the current legal situation regarding the protection of personal data and the definition of informational self-determination and privacy, basic types of protection concepts and the applicable technologies and protective measures are discussed in detail.

The following core topics are covered:

- Basic protection goals and guarantee goals in the area of information security and data protection
- Technical-organisational measures for implementing the objectives/requirements
- Measures for access and access control
- Data protection-relevant functions for mobile devices
- Security and data protection in cloud computing and big data analytics
- Special privacy-preserving technologies ("privacy-preserving technologies")

The second part deals with technical aspects of protecting data and systems. The aim of the lecture is to look at attacks on data from different perspectives. These include the perspective of the person who wants to store data securely, the person who wants to recognise or investigate attacks, but also the perspective of the attacker himself. The lecture includes the following core topics:

- Cyber Kill Chain and MITRA Att&ck Framework
- Cryptography
- steganography
- Attacks on cryptography
- Quantum key exchange
- Authentication
- Passwords
- Zero Knowledge Proof
- attacks
- Blockchain
- Blockchain basics
- Attacks
- NFTs
- Ordinals
- Forensics

- Basic principles
- Preservation of evidence
- Carving

Practical demonstrations on the topics of incident response and cryptography complement the lecture.

Examination

Learning outcomes

The aim of the course is to convey the basic requirements of data protection in Germany and the resulting measures in the area of information security and the protection of personal data. The focus is on technical aspects.

After successfully completing the module, students will be able to

- Understand and differentiate between terms such as "information security", "data protection", "informational self-determination", "privacy", "anonymity"
- Analyse legal and normative requirements with regard to the protection and guarantee objectives they contain and apply them to a given context
- Derive technical and organisational measures from the requirements with regard to their suitability for implementing protection and guarantee objectives and evaluate them with regard to their protective effect
- Know and understand the functioning of basic technologies and procedures in the field of information security and data protection (e.g. procedures from the areas of anonymisation, encryption, authentication, communication security, incident detection & response, security testing), including the associated potential vulnerabilities and attack possibilities
- Develop a protection concept for a given scenario or a given application context (e.g. protecting the data of a website or an end device) in which these measures are used

Learning outcomes

Students will be familiar with the basic principles, components and processes of IoT systems. Students gain an insight into architectures, hardware platforms, communication technology, protocols, programming (device & cloud) and security concepts.

Students will be able to explain how individual components and processes work in IoT systems. They can describe and explain how architectures, protocols and security concepts interact.

Students will be able to apply the fundamentals they have learnt to problems and use suitable IoT components in practice. As part of the course, they develop an IoT prototype to experience what they have learnt hands-on.

Students are able to make individual statements about systems, work out differences and differentiate between systems.

Students can make well-founded decisions about the use of different IoT systems. They are able to evaluate the advantages and disadvantages of certain architectures, protocols or platforms.

By developing the IoT prototype, students design their own system that integrates different components and processes. |

Course Practical module; 120 ECTS credits

Recommended prerequisites for the participation in the module

none

Content

In the Mobile and Ubiquitous Design module, students develop comprehensive skills in context-sensitive interaction design. The focus is on designing digital products and services that adapt flexibly to mobile usage situations and ubiquitous environments. The user-centred design process encompasses all relevant phases - from analysing the context of use, conception and prototype implementation through to systematic evaluation.

Particular emphasis is placed on the visual, functional and interactive quality of the solution: At the end of the module, students create a fully clickable high-fidelity prototype that realistically simulates central interactions, interface logic and design elements. This is developed using the Figma design tool and embedded in a structured, professionally designed design brochure that documents the usage scenario, the derivation of the design decisions and reflections on the development process. This results in design-based, practical solutions that are both convincing in terms of content and communicable.

Specific contents are

- Design principles of mobile and ubiquitous systems
- Context-sensitive interaction design (location, time, movement, environment)
- Methods of human-centred and participatory design
- UX/UI design for mobile contexts (touch, language, responsive design)
- Wireframing, low-fidelity and high-fidelity prototyping with Figma
- Design and construction of interactive click prototypes
- Usability testing, user testing and feedback integration
- Documentation and visualisation of design processes (structure, style, argumentation)
- Design ethics, accessibility and data protection in ubiquitous systems
- Project work: conception, prototyping and design brochure

Examination

Content

- Methods and technologies for the systematic, preferably automatic collection and evaluation of business-relevant information from the Internet, in particular from the World Wide Web
- Web intelligence as a type of "data reconnaissance/procurement via the web",
- for better decisions and
- for the development of more useful web applications.
- Practical insights into the following topics:
 - Data analytics (e.g. pivot, OLAP, data warehousing, BigQuery),
 - Web applications (e.g. Low-Code, AppSheet, MediaWiki),
 - Data Lake (e.g. Big Data, NoSQL, Cloud, SaaS, MapReduce),
 - Graph data (e.g. knowledge graph, semantic web, reasoning),
 - Text data (e.g. natural language processing, large language model, ChatGPT),
 - Internet of Things (e.g. sensor, actuator, micro:bit),
 - Artificial intelligence (e.g. machine learning, responsible AI).

Each course consists of approximately 50% lecture and 50% exercise. The contents of the lecture are taught in lectures and presentations. Students are encouraged to study the literature and analyse the content of the topics.

In addition to the lecturer, up to two external speakers will give practical presentations.

In the exercises, students will work together in groups to answer specific questions and work on practical examples. You will need your own laptop or one laptop per group to complete the exercises.

The lecture slides, sample solutions for the exercises and additional material will be made available on the THWS e-learning platform (<https://elearning.fhws.de>).

The portfolio examination form is chosen for the award of credit points. This involves 6-8 portfolio tasks, which students are allowed to solve on predetermined dates in 1-3-page documents.

Module: 5102120,6102600

Business and IT Law

Module profile

Exam number

5102120,6102600

Duration

1 semester

Frequency

Every winter semester

Credit hours (SWS)

4

ECTS-Credits (CP)

5.0

Workload

Guided study time:

Presence time: 60 hrs

Self-study: 90 hrs

Total: 150 hrs

Teaching format

Seminar-style instruction

Language of instruction

German

Organisation

Responsible lecturer

Prof. Dr. Oliver Ehret

Lecturer(s)

Prof. Dr. Oliver Ehret

Applicability

BEC, BIN

Semester according to SPO

7. semester

Type of module

Compulsory module

Required prerequisites for the participation in the module according to the SPO

none

Recommended prerequisites for the participation in the module

none

Content

General contract law

Special contract law with regard to IT, special types of contracts Basic principles of copyright law

Overview of relevant areas of intellectual property law Internet law

Data protection law

Examination

Required prerequisites for the participation in the examination according to the SPO appendix

None

Examination - type

Written exam (sP) according to § 23 APO

Examination - length/format

90 minutes

The concrete length/format of the examination will be determined in the study plan.

Language of examination

German

Condition for the award of credit points

None

Learning outcomes

1. students know the basic terms and concepts of our legal system and its basic structures.
2. students understand the role of law for computer scientists and the relevance of legal knowledge in the IT sector.
3. students acquire the basic principles of general private and public law and their application in practice.
4. students explain IT legal terms and are able to categorise them in the context of relevant areas of law and contractual areas.
5. students recognise legal risks in the IT sector, are able to assess them and develop strategies to limit them.
6. students develop practical skills in dealing with IT-relevant legal problems, including knowledge of basic types of contracts in the IT sector.
7. students understand the principles of data protection, especially in the IT sector and their significance in an international context.
8. students reflect on the interlinking of computer science, architecture of IT systems, information security and data protection in order to gain a holistic understanding of these topics.
